It is really an awesome ebook that I have ever read. It typically fails to expense a lot of. I am very easily can get a enjoyment of studying a written ebook.

In mining work it frequently happens that an electric conductor is exposed to the action of most air and acid water. This condition, although common to nearly all conductors installed in wet parts of a mine, is especially noticeable in shafts and bore holes through which signal, telephone, or power cables are led under ground. Large quantities of moisture are often present in such places, and in the shafts of coal mines that have several levels the moisture below the first level is sometimes very acidulous. Not all conductors used in mines are insulated, but some of them are, and whenever multiple-conductor cables are used they must, of course, be insulated. The use of such cables in shafts, bore holes, and even under ground will increase as the use of alternating current increases. At present the practice of consolidating mine power plants, or purchasing power from central stations, seems to be coming into favor, and in either case alternating current will be used for distributing the power. Therefore it seems probable that insulated conductors will be used in mines more extensively in the future than in the past. It is a matter of common experience that mine water has a harmful action upon the insulation of electric conductors and often so impairs the insulation that shocks may be received from conductors that have previously been considered safe. Sometimes the insulation is completely destroyed, causing bad leakages to the earth and short circuits of multiple-conductor cables. The...
